It currently consists of 32 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Insert size: 161000; agarose-fp Insert size: 149029; sum-of-contigs Quality coverage: 3.1 in 020 bases; Quality coverage: 3.3 in Q20 bases;

                                                                                             NOTE: This is a 'working draft' sequence. It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING

Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. I MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc Louis

donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E., Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute (http://bacpac.med.buffalo.edu)

NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP11-1077K22; the clone sequenced to the right is RP11-4705. Actual start of this clone is at base position 1 of RP11-459I19; actual end is at base position 206854 of RP11-459I19.

Data from AC079810 and AC073128 was used to finish this clone, AC009974. Polymorphisms have been identified between AC073128 AC009974. A single plasmid region exists betten 38812-38903 unresolved tandem in the HERV SVA exists between 184390-185163. ≩ and

FEATURES source suggests that approximately 1700 bps are missing. Location/Qualifiers /organism="Homo sapiens" /db_xref="taxon:9606" /chromosome="2" 1. .206854

* NOTE: This is a 'working draft' sequence. It currently
* consists of 3 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

                                                                                                                                                                           ő
                                                                                                                                                                                                                                                                                                                      RESULT
                                                                                                                                                                                                                                                                                                                                                        Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and CC invention also relates to vectors and recombinant host cells comprising a concleotide of the invention, methods of producing the novel polypeptides, and thodies against the polypeptides, methods of identifying compounds which CC polypeptides in a sample, and methods of identifying compounds which CC polypeptides of the invention have homology to known proteins, thereby CC giving an insight into their probable biological activities, and hence CC potential therapeutic applications. The polypeptides of the invention have homology to known proteins, thereby CC giving an insight into their probable biological activities, and hence CC potential therapeutic applications. The polypeptides of the invention may differentiation activities, including cytokine, cell proliferation or cell conditions activities; thereby conditions the polypeptides of the invention may be commondulatory activity; activing the sample and the conditions of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include concerns, haematopoletic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions include conservers, haematopoletic disorders (e.g., myeloid or lymphoid cell concerns, haematopoletides included with tissue regeneration and crepair (or nucleic acids encoding them) may be used to promote wound to bacterial and fungal infections in addition to immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders (e.g., and abnormal cell can be used to augment or replace cells damaged by illness, and and cells can be used to augment or replace cells damaged by illness, and in drug contains, and in the present sequence represents a cDNA encoding a cover human polypeptides. The present sequence represents a cDNA encoding a cover human cells of the invention.
                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 429; 1963pp;

This sequence represents the full length cDNA encoding the human AMP-activated protein kinase gamma 3 subunit (PRKAG3). Detecting the presence of the PRKAG3 DNA, or a variant, is useful in determining a risk estimate of a metabolic disease, such as diabetes or obesity, in a subject. The variation may occur in exons 3, 4 or 10. In exon 3 variation may be a substitution of a G for a C at nucleotide 320, resulting in the amino acid substitution P71a; in exon 4 variation may be a substitution of a T for a C at nucleotide 550; and in exon 10 variation may be a substitution of a T for a C at nucleotide 1037, resulting in the amino acid substitution R71a of a t nucleotide 1037, resulting in the amino acid substitution R71a of these variations is based on the full length cDNA as given, rather than on position 1 of the open reading frame.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      В
   (AMP) activated kinase (AMPK) gamma subunit muscle-specific isoform, PRKAG3. Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as therapeutic for treating carbohydrate metabolism disorders as diabetes, obesity, and disorders associated with muscle metabolism such as myopathy and cardiovascular diseases, to modulate AMPK activity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic evaluation, genetic testing and prognosis of a metabolic disorder, primers that can detect preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, arc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allele of PRKAG3. Transgenic animal and host cell transformed with PRKAG3 or a heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPK activity. Nucleic acid encoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain of PRKAG3 and is useful in gene therapy.
                                                                                                                                                                                    Andersson L, |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC useful as therapeutic for treating carbohydrate metabolism disorders such as diabetes, obesity, and disorders associated with muscle metabolism CC such as myopathy and cardiovascular diseases, to modulate AMPK CC activity, and for restoring a normal AMPK function. PRRAG3 sequence CC and its functionally altered mutants are useful for the diagnostic CC valuation, genetic testing and prognosis of a metabolic disorder. CC preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRRAG3, are CC useful for detecting a dysfunction of carbohydrate metabolism resulting CC from the expression of a functionally altered allele of PRRAG3 or a heterotrimeric AMPK consisting of PRRAG3 or its mutant, are useful for cerening compounds able to modulate AMPK activity. Nucleic acid concoding PRRAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain compounds and in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a cDNA encoding pig adenosine monophosphate (C (AMP) activated kinase (AMPK) gamma subunit muscle-specific isoform, PRKAG3. Prkag3 gene is located in the RN locus of chromosome 15.

CC Mutation in Prkag3 results in an altered regulation of carbobhydrate (C metabolism, particularly in skeletal muscle. PRKAG3 is useful as the present of carbobhydrate metabolism disorders such as contained with muscle metabolism (C such as myopathy and carbobhydrate metabolism disorders such as myopathy and cardiovascular diseases, to modulate AMPK (C activity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic cevaluation, genetic testing and prognosis of a metabolic disorder, C preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3 are useful for detecting a dysfunctionally altered allele of PRKAG3. C useful for detecting a dysfunctionally altered allele of PRKAG3. C the expression of a functionally altered allele of PRKAG3. C heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPK activity. Nucleic acid c encoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain c of PRKAG3 and is niseful for agene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                       ş
        В
                                                                                                                                                                                                          cc such as myopathy and cardiovascular diseases, to modulate AMPK
Cc activity, and for restoring a normal AMPK function. PRRAG3 sequence
Cc and its functionally altered mutants are useful for the diagnostic
Cc evaluation, genetic testing and prognosis of a metabolic disorder.
Cc preferably a carbohydrate metabolism disorder. Primers that can detect
Cc a genetic polymorphic marker linked to a sequence encoding pRRAG3, are
Cc useful for detecting a dysfunction of carbohydrate metabolism resulting
Cc from the expression of a functionally altered allele of PRRAG3.
Cc renosgenic animal and host cell transformed with PRRAG3 or a
Cc heterotrimeric AMPK consisting of PRRAG3 or its mutant, are useful for
Cc screening compounds able to modulate AMPK activity. Nucleic acid
Cc encoding PRRAG3 is useful for detecting mutations in a Prkag3 gene, or
Cc in a sequence encoding the first cystathione beta synthase (CBS) domain
Cc of PRRAG3 and is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                            (AMP) activated kinase (AMPK) gamma subunit muscle-specific isoform, complete PRKAG3. Prkag3 gene is located in the RN locus of chromosome 15. Mutation in Prkag3 results in a litered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as therapeutic for treating carbohydrate metabolism disorders such as diabetes, obesity, and disorders associated with muscle metabolism
                                                                                                                                                                                          Sequence 1873

                                            evaluation, genetic testing and prognosis of a metabolic disorder, preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allele of PRKAG3. Transgenic animal and host cell transformed with PRKAG3 or a heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPK activity. Nucleic acid encoding PRKAG3 is useful for detecting mutations in a PrKag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain of PRKAG3 and is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                  diabetes, obesity, and disorders associated with muscle metabolism such as myopathy and cardiovascular diseases, to modulate AMPK activity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is pig adenosine monophosphate (AMP)-activated kinase (AMPK) gamma subunit muscle-specific isoform, PRKAG3 splice variant DNA. Prkag3 gene is located in the RN locus of chromosome I Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as therapeutic for treating carbohydrate metabolism disorders such as displaced to the property of the property of the present of the pres
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New variants of the gamma subunit of vertebrate adenosine monophosphate-activated kinase for diagnosis or treatment of disorders associated with energy metabolism such as diabetes, obesity, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequences given in AAH43681-84 represents genomic fragments encoding the human AMP-activated protein kinase gamma 3 subunit (PRKAG3). Detecting the presence of the PRKAG3 DNA, or a variant, is useful in determining a risk estimate of a metabolic disease, such as diabetes or obesity, in a subject. The variation may occur in exons 3, 4 or 10. In exon 3 variation may be a substitution of a G for a C at nucleotide 320, resulting in the amino acid substitution P71A; in exon 4 variation may be a substitution of a T for a C at nucleotide 550; and in exon 10 variation may be a substitution of a T for a C at nucleotide 550; and in exon 10 variation may be a substitution of a T for a C at nucleotide 550; and in exon 10 variation may be a substitution of a T for a C at nucleotide 1037, resulting in the amino acid substitution R340W. There may also be nucleotide variation in intron 6.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 C alignments, and a consensus sequence was derived from the extended
C and overlapping Incyte clones 3075712/HRARNOTD1, 84220/PROSTUTO5,
C 136747/SCORNONO2, 145972 and 145802/PENITUTO1 and 1479332/CORPNOTO2.
C DAPK-7 shows 73% homology with the human foetal liver AMPK gamma
C subunit (G1 135856), and is associated with CDNA libraries which
C are immortalised or cancerous and show inflammatory or immune
C responses. The invention provides disease associated protein kinases
C DAPK-1 to DAPK-7 (see AAM88432-38) and CDNA clones encoding them (see
CC AAX06831-36 and AAX06882), as well as expression vectors, host cells,
CC agonists, antagonists and antibodies. The invention further provides
C uses of such products in the diagnosis, prevention and treatment of
CC diseases associated with cell proliferation, especially cancer or an
CC immune response (claimed). Conditions that may be treated include
CC anteriosclerosis, bronchitis, emphysema, hypereosinophilia,
myocardial or pericardial inflammation, rheumatoid arthritis,
CC Addison's disease, AIDS, anaemia, atherosclerosis, various diseases
CC of the disease, AIDS, anaemia, atherosclerosis, various diseases

                       CC polypeptide (II) sequences. (I) is useful as hybridisation probes,
CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome
CC and gene mapping, and in recombinant production of (II). The
CC polynucleotides are also used in diagnostics as expressed sequence tags
CC for identifying expressed genes. (I) is useful in gene therapy techniques
CC (II). (II) is useful for generating antibodies against it, detecting or
CC quantitating a polypeptide in tissue, as molecular weight markers and as
CC a food supplement. (II) and its binding partners are useful in medical
CC imaging of sites expressing (II). (I) and (II) are useful for treating
CC disorders involving aberrant protein expression or biological activity.
CC The polypeptide and polynucleotide sequences have applications in
CC diagnostics, forensics, gene mapping, identification of mutations
CC responsible for genetic disorders or other traits to assess blodiversity
CC and to produce other types of data and products dependent on DNA and
CC diagnostic coding sequences of the invention.
CC Note: The sequence data for this patent did not appear in the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at fip. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and

                                                                                                                                                                                                                               sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide which comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the the third that the primers are also useful for the the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13638 and AAH13633 represent human amino acid sequences; AAB9246 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the amount of the sequences; AAB9246 to AAH13632 represent human amino acid sequences; and AAH13629 to AAH13632 represent imman amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5' end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                11-JAN-2000;

                                                                                                                                                           and both are subjected to conditions in which the strains exhibit different geotactic behaviour. Genes that are differentially expressed the first strain relative to the second strain are then identified. Mammalian genes having substantially the same nucleic acid sequence as these modulate the mammalian vestibular system. Compounds containing these genes are used to decrease the symptoms of graviperceptive disorders such as motion sickness, vertigo, labyrinthitis, Meniere's disease, accustic neuroma, multiple sclerosis, syphilis, trauma, infection of the middle ear, exposure to ototoxic agents and epilepsy.
                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                vestibular system modulating activity. The DNA sequences can be used in method whereby a first and second strain of an invertebrate is obtained,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGITG-ABLIGISI), expressed DNA sequences (ABLIGITG-ABLIGISI), expressed DNA sequences (ABLIGITG-ABLIGISI).
Drosophila melanogaster.
                                                                                                Drosophila melanogaster expressed polynucleotide SEQ ID NO 19076
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specification, but was obtained in electroni
at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid genes from Drosophila and interactions -

                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Tissue Procurement: Martha Rebbert, Steven L. Klein, Ph.D.
cDNA Library Preparation: Life Technologies, Inc.
cDNA Library Arrayed by: The I.M.A.G.E. Consortium (LLNL)
DNA Sequencing by: Washington University Genome Sequencing Center
Clone distribution: Xenopus clones from this library are available
through the I.M.A.G.E. Consortium/LLNL at: info@image.llnl.gov
Seq primer: -40RP from Gibco
                                                                                                                                                            cDNA Library Preparation: Life Technologies, Inc.

SS-library phagemids were prepared by mass excision from the original library and normalized by hybridization to biotinylated driver (prepared from the same library by PCR) to Cot-omega of 11. After removal of hybrids and excess driver by streptavidin sepharose chromatography, the ss-phagemids were made double stranded and electroporated into Top-10 F'. Original library contruction by Bruce Blumberg (Blumberg et al., 1991 Science 253, 194-196; Hawlet et al., 1995, Genes Dev. 9, 2923-2935). Normalized by Jihwan Song (Song, Cho and Blumberg, unpublished). Note: This is a Xenopus Gene Collection (XGC) library."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
